**The SUCEST-FUN Project:
Using genomic tools for the
improvement of biomass in sugarcane**

The SUCEST-FUN Project: <http://sucest-fun.org>

Domestication and early evolution of sugarcane

Modern sugarcane cultivars

One of the most productive cultivated plants - a large biomass

Commercial sugarcane is vegetatively propagated through stem cuttings

In 12 months the plant will reach 4-5 meters with the extractable culm measuring 2-3 meters

After harvest, underground buds will sprout giving rise to a new crop (6 harvests)

C4 carbohydrate metabolism - large amount of carbon partitioned into sucrose (up to 42% of the stalk dry weight, around 0.7 M in mature internodes)

488 million tons of crushed stems (Brazil 2007/2008)

51.1% ethanol

48.9% sugar

Up to 90% of the bagasse used for energy co-generation

Sugarcane in Brazil:
1532

Mandated addition of
Ethanol to fuel: 1929

Produção e Produtividade

Breeding Program

320 crossings
200 mil plantlets
(genotypes)

Interspecific breeding: a major breakthrough in modern sugarcane breeding

Solved some of the disease problems but also provided increased yields, improved ratooning ability and adaptability for growth under various stress conditions

Contributing genera: **Saccharum**, **Erianthus**, **Miscanthus**, **Sclerostachya** and **Narenga**

Saccharum genus (six polyploid taxonomic groups):

Wild species

S. spontaneum (2n=40 to 128)

S. robustum (2n= 60, 80 and up to 200)

Early cultivars

S. officinarum (2n= 80)

S. barberi (2n=81-124)

S. sinense (2n=116-120)

Marginal species

S. edule (2n = 60 to 122))

Giant Genome (n \cong 750-930 Mpb)

Polyploid (2n = 70-120 cromossomos)

~10 Gb

qRT-PCR (10)

SAS total number: 43,131

SAS with homologues sequences in Sorgho: 18,216 (at least 95% of identity)

5Kb of Sorghum

BLAST genome on <http://www.phytozome.net/>

PLACE

Database of Plant Cis-acting
Regulatory DNA Elements

841 sites identified

135 different motifs

18 related to dehydration, ABA signalling or sucrose regulation

SURE2STPAT21 - Sucrose responsive element

DRECRTCOREAT - core motif of DRE/CRT
ABRELATERD1 - Responsive to dehydration
ABRE3HVA1 - ABA responsive element

- Genome sequencing
- Comparative, structural and evolutionary genomics of grasses
- Development of new sugar cane cultivars
- Biochemical, physiological and agronomic evaluation of cultivars
- Discovery of genes associated with agronomic characteristics of interest
- Analysis of transcriptome, proteome and metabolome
- Signaling, regulation of gene expression and regulatory networks
- Genetic transformation of sugar cane and other grasses
- Molecular markers
- Physical, genetic and molecular mapping of genomes
- Metabolic networks of the production of carbohydrates and sucrose
- Cell wall structure and function, cellulolytic fungi
- Bioinformatics
- Impact of climate changes, sustainability and productivity
- Environmental impact of GM sugar cane and biosafety
- Intellectual property and technology transfer

Responses**

**Adaptation
Growth
Development**

- Basic and biotechnological research on sugar cane and other biofuel plants

- Broad and interdisciplinary

- Systemic approaches on sugar cane biology

- Relation among genome, metabolism, physiological and adaptive responses to the environment

- Effective impact on the improvement of cultivars of interest

- Paths to genetically manipulate the energy metabolism of cultivated plants

- New alternatives of biofuel
